New Products

New scope was opened with an investment in a new cryogenic grinding system. Our long experience with low temperature grinding combined with the know-how of thermoplastic materials and their applications result in a new concept for manufacturing of fine powder and production of fine particle size distributions.

Advantage

- More "clean" grain size for scatter coating (e.g. 100-400my / 200-600my) with less particles in the range of < 100my or < 200my
- Grain sizes < 100my without high content on additives
- No negative impact on bonding strength and wash resistance by additives

First new products

- abifor 1605, 0-100my (EVA; Ethylene vinyl acetate)
- abifor AC-2033, 0-100my (TPU; Thermoplastic Polyurethane)

Applications

- Standard:

CoPA, CoPES and HDPE (0-63my / 0-80my):

- Past coating
- Double dot coating

- New:

EVA und TPU fine powder (<100my):

- Past coatings for leather interlinings
- Additive of inks for fusing of labels

- Future:

Other thermoplastic fine powders will be checked

Technical data sheets and samples are available for tests. Our specialists will be at yours disposal and provide you with all necessary information.
